INTRODUCTION TO LIGHTING FOR THE AGING EYE

As we age, natural physical changes of the human eye diminish our visual abilities including our ability to read.

The cornea becomes more opaque, the lens absorbs more light, and the pupil diameter decreases, resulting in a reduction in retinal illuminance. Increased fat deposits in the cornea and lens lead to an increase in light scattering inside the eye, making it more difficult for the eye to recognize the visual images. The lens yellows and absorbs a higher amount of blue wavelengths. Last but not least, weaker ciliary muscles and an increased rigidity and hardening of the lens reduce our ability to focus and to adjust to different light levels easily.

I have initiated and supported research at the University of Colorado at Boulder to study and develop the scientific basis of lighting for the aging eye and to research how good lighting can mitigate the effects of the natural physical changes that we all are subjected to as time passes. Some of the results of this study are being incorporated into our Meran series of table, chair-side and floor reading lamps.

The reduction in retinal illuminance requires a light level of more than 100 footcandles for optimal reading performance. The 12 Watt LED, as well as the shape and construction of the inside of the reflector, allow for a light level in excess of 100 footcandles. A matte glass diffuser and a reflector that focuses the light only on the reading material will reduce glare and scattering. The ability to shift the colour temperature from 3000 to 4500 and finally to 6000 Kelvin allows for a better contrast at the higher Kelvin temperature, and therefore improving the reading performance

Full range dimming controls allow for personal optimal light levels which will minimize the need for the eye to adjust regardless of the different light intensities in the room. The majority of the Arnsberg reading and task lamps also have moveable reflectors and infinite arm positions so that the light is utilized in the most effective manner.

INTRODUCTION TO TORCHIERES

One of the first lights used by humans were torch lights. Originally, they were made out of wooden sticks with some cloth wrapped around it. When they were dipped into a flammable liquid like plant or fish oil and then lit, they became torch lights. The Romans added sulphur and lime to the liquid and then the torch would not extinguish, even if dipped into water. They also were used in religious processions and over time, they became a symbol of hope and enlightenment.

The Statue of Liberty, enlightening the entrance to New York Harbour, is probably the most famous torch today.

Our torchiere lamps carry this tradition into the 21st century. They provide brilliant and ample light, but very efficiently with our new Q Series Light Engines. The series starts with Q6 and 2700 Lumens (Leipzig Series), Q9 and 4050 Lumens (Tampa Series), and last but not least Q12 and 5400 Lumens (Dubai Series). The CRI is > 95.
